

1. Basic Access

👉 Given dictionary:

```
student = {"name": "Amit", "age": 20, "city": "Jaipur"}
```

Q1: name print karo

Q2: city print karo

Q3: age 1 se increase karo

◆ 2. Add New Key

```
student = {"name": "Amit", "age": 20}
```

Q: "class" = "BTech" add karo

◆ 3. Update Value

```
student = {"name": "Amit", "age": 20, "class": "BCA"}
```

Q: class ko "BTech" me change karo

◆ 4. Remove Key

```
student = {"name": "Amit", "age": 20, "city": "Jaipur"}
```

Q1: age remove karo

Q2: city remove karo

◆ 5. popitem Practice

```
student = {"a": 1, "b": 2, "c": 3}
```

Q: last item remove karke print karo

◆ 6..setdefault Practice

```
student = {"name": "Amit"}
```

Q1: "age" ko setdefault se 18 add karo

Q2: "name" ko setdefault se try karo (kya output aayega?)

◆ 7. Count Frequency (Important 🔥)

```
s = "banana"
```

Q: har letter ki frequency dictionary me store karo

Output:

```
{'b':1, 'a':3, 'n':2}
```

◆ 8. Find Max Value Key

```
marks = {"a":50, "b":80, "c":70}
```

Q: sabse zyada marks wala student ka naam print karo

◆ 9. Merge Dictionaries

```
d1 = {"a":1, "b":2}
```

```
d2 = {"c":3, "d":4}
```

Q: dono ko merge karo

◆ 10. Nested Dictionary (Easy Intro)

```
students = {  
    "stu1":{"name":"Amit","age":20},  
    "stu2":{"name":"Rahul","age":21}  
}
```

Q1: stu2 ka name print karo

Q2: stu1 ki age 1 se increase karo

🔥 Bonus Challenge (Important)

👉 Word count problem:

```
sentence = "i love python and i love coding"
```

Output:

```
{'i':2,'love':2,'python':1,'and':1,'coding':1}
```
